

# Integrated Assessment Modeling of post-growth scenarios

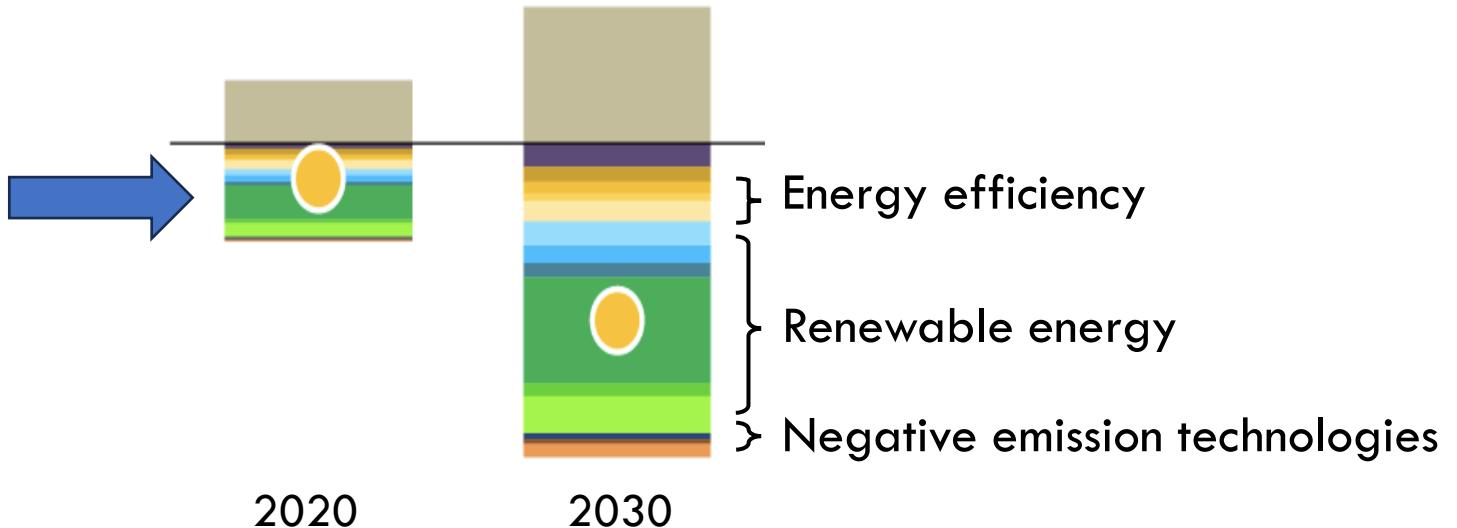

Presenter: Dr. Mengyu Li  
Postdoctoral Research Fellow  
Integrated Sustainability Analysis  
University of Sydney, Australia  
[mengyu.li@sydney.edu.au](mailto:mengyu.li@sydney.edu.au)

# Continued growth in mitigation scenarios

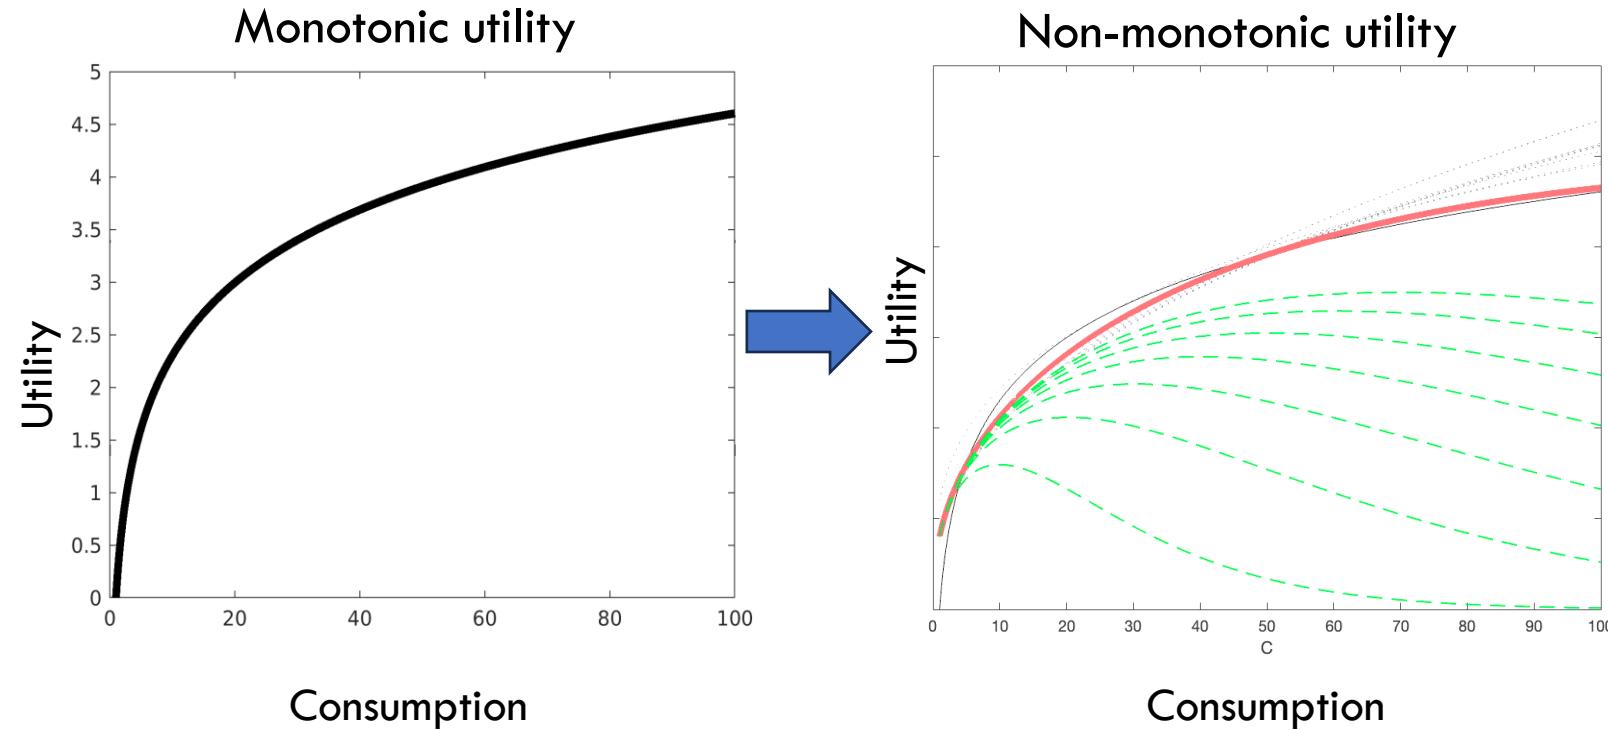

## Increasing consumption

# Three emission reduction levers

## Question: if and how degrowth is needed as the fourth lever?

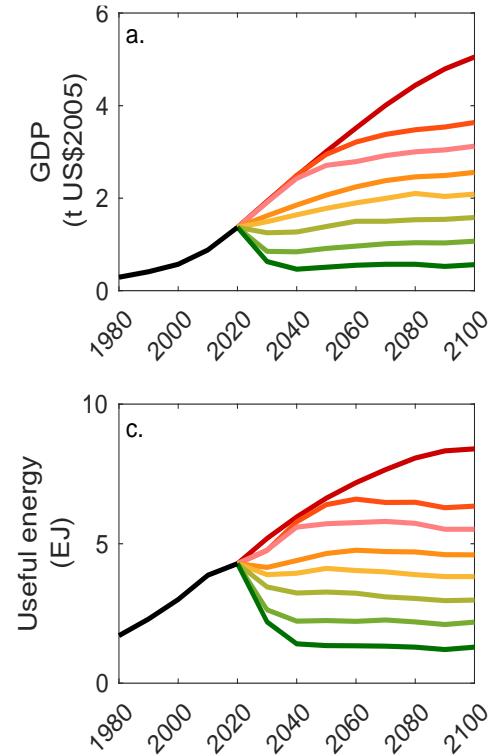

# Modifying the ‘Growth-embedded’ MESSAGE IAM to enable degrowth scenarios (Li&a)

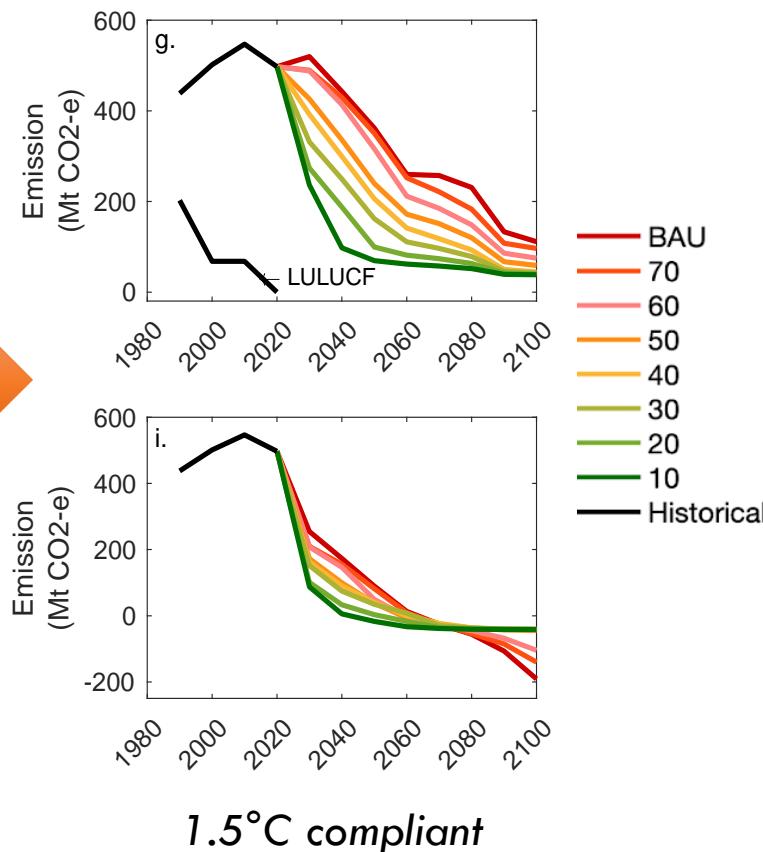

- Modifications:**
- Non-monotonic utility
  - Disable internal GDP and demand calibration;
  - Iteration variable: demand
- Solutions:**
- Endogenous GDP, demand, and techno-economic feedback

# Degrowth Scenarios (Li&al): Individual consumption: 70 and 10 US \$k/capita

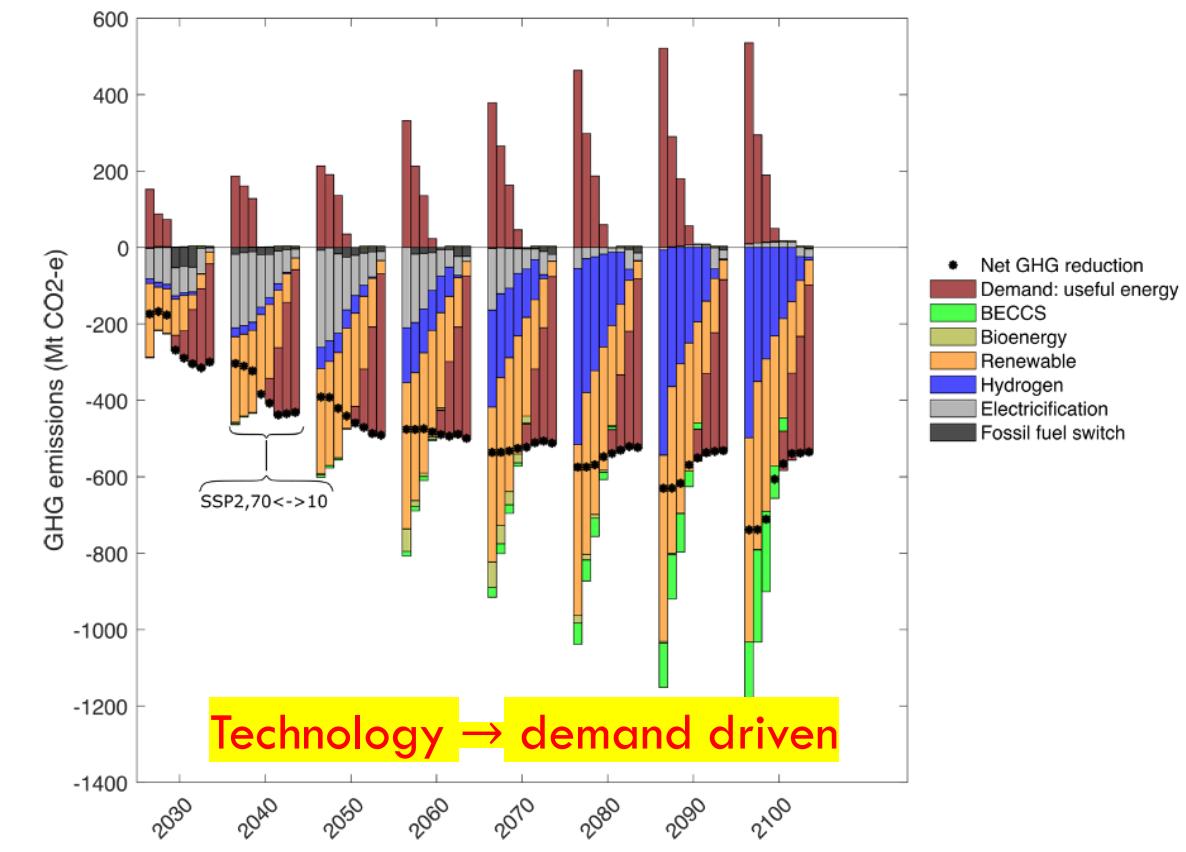

Endogenous GDP & demand

Renewable-dominated

Emission reduction levers

Economic feedback on emissions

Levers in 1.5°-compliant pathways
